

# Data Communication and Networks (CSCI 4/5300) Project

## Part 2 - total 18 points

**Due on Nov. 15 (11:59 pm), 2014**

### Design of a Daemon Process Acting as a TCP Proxy Server

#### 1. Project description

In this project, you are required to implement a daemon process that acts as a general TCP proxy server. The daemon performs the following activities:

- (1) The daemon listens for TCP connections on a specified port number.
- (2) When a new client initiates a TCP connection request, the daemon accepts the request and establishes a new TCP connection with the new client.
  - (a) The daemon forks a child process that is dedicated to handling the new client.
  - (b) The child process establishes a new TCP connection to a pre-assigned port on the actual targeted server.
  - (c) The child process falls into a loop in which it acts as an intermediary exchanging data (reading/writing or writing/reading) between the client and the targeted server.
- (3) Once a child has been forked, the daemon process resumes listening for additional TCP connections.

#### 2. Requirements

- (a) You may treat this project as an individual project or form a project team of no more than 2 members.
- (b) You are given the flexibility to choose one of your favorite programming languages for implementation either in Windows or Linux environment.

Note: C language is usually preferred for network programming.

*Hint: the following functions may be used if C is chosen for implementation:*

<code>socket()</code>	<code>htons()</code>
<code>bind()</code>	<code>listen()</code>
<code>accept()</code>	<code>fork()</code>
<code>close()</code>	<code>inet_addr()</code>
<code>gethostbyname()</code>	<code>signal()</code>
<code>FD_ZERO()</code>	<code>FD_SET()</code>
<code>FD_ISSET()</code>	<code>select()</code>
<code>read()</code>	<code>write()</code>

- (c) Test your daemon as a proxy server for our department web server <http://www.mtsu.edu/csc/> .

#### 3. Submissions

- (a) You must submit all your source code of the daemon program, executable files, and a document that describes the use of your program and how to run it.
- (b) Printout of the first 6<sup>th</sup> line of the HTTP header of a “GET” command sent by the client to the daemon acting as the proxy server for the web server <http://www.google.com> .
- (c) You need to demonstrate your project in class at the end of the semester.

**Notes:**

I found a few socket programming websites that might be helpful for your project. Some of them did a good job explaining those data structures and function calls you might need to implement in the project.
